

Automated Network Request Management in ServiceNow

Project Documentation — Phase 1 to Phase 5

Platform: ServiceNow

Project purpose: Provide a structured workflow for managing network requests, from requirement analysis and backend configuration through user-interface customization, testing, security, deployment, and final documentation.

Phase 1: Requirement Analysis & Planning

Business Objectives

Gather client and stakeholder needs for network request management and define clear goals for automating request handling.

Functional Scope

Define request creation, request tracking, assignment, status management, approvals, notifications, and related administrative functions.

Stakeholder Mapping

Identify requesters, network/IT support teams, administrators, project reviewers, and other stakeholders who interact with the system.

Execution Roadmap

Plan the work across backend configuration, UI/UX, testing and security, deployment, documentation, and final presentation.

Phase Deliverables

- Requirements, functional scope, stakeholders, roadmap

Phase 2: Backend Development & Configurations

ServiceNow Data Configuration

Configure the tables, fields, choices, and relationships required to represent network requests and their lifecycle.

Business Rules

Implement server-side logic to automate validation, record processing, and request lifecycle actions.

Server-side Scripting

Use ServiceNow server-side scripting patterns such as GlideRecord where database records need to be queried or updated.

Workflow / Automation

Configure appropriate automation for assignment, status changes, approvals, notifications, or other project-specific network request actions.

Backend Validation

Verify that the configured backend logic produces the expected results for valid and invalid request scenarios.

Phase Deliverables

- Tables/fields, backend configurations, Business Rules, automation, scripts

Phase 3: UI/UX Development & Customization

Request Form

Design and configure the network request form so users can enter the information required to process a request.

Form Layout

Organize fields and sections to make request submission and record review clear and efficient.

Workspace / Kanban

Use the ServiceNow workspace or Kanban-style view where applicable to support request tracking and operational visibility.

User Experience

Ensure that users can easily create, view, update, and track requests according to their roles.

UI Verification

Test form behavior, field visibility, actions, and user-facing results.

Phase Deliverables

- Forms, workspace/Kanban views, UI customization, screenshots

Phase 4: Data Migration, Testing & Security

Data Preparation

Prepare any existing network request information required for migration or testing.

Functional Testing

Test request creation, updates, assignment, status transitions, approvals, notifications, and automation.

Security Testing

Verify roles, permissions, access controls, and visibility of network request records.

Negative Testing

Check how the application handles missing, invalid, or unauthorized data and actions.

Defect Resolution

Record issues found during testing and correct the relevant configuration, scripts, or access settings.

Phase Deliverables

- Test cases, test results, security/access verification, defect fixes

Phase 5: Deployment, Documentation & Final Presentation

Deployment Preparation

Review configuration, scripts, data, security, dependencies, and testing results before final deployment.

Documentation

Maintain phase-wise documentation, screenshots, configuration evidence, testing results, and user/project instructions.

GitHub Repository

Organize the final documentation, screenshots, permitted project files, README, and demo information in a clear GitHub repository.

Final Presentation

Explain the problem, solution, implementation, workflow, testing, and final outcome.

Project Handover

Provide the final project report, repository link, demo information, and supporting evidence for evaluation.

Phase Deliverables

- Final report, GitHub repository, demo, presentation, deployment evidence

Project Conclusion

Automated Network Request Management in ServiceNow provides a structured approach to handling network-related requests. The project lifecycle covers requirement planning, backend configuration and automation, user-interface customization, testing and security, and final deployment and documentation. The final GitHub repository should provide clear evidence of the implementation through documentation, screenshots, permitted configuration or script files, and a project README.

Submission Note

The project screenshot shows the project title as “Automated Network Request Management in ServiceNow” and the five-phase structure. Before final submission, add your actual ServiceNow screenshots, configuration names, test results, repository URL, and demo URL so the documentation matches the implementation exactly.
