

Automated Network Request Management in ServiceNow

Project Documentation for GitHub Repository

1. Project Overview

This project implements an automated network request management process in ServiceNow. The objective is to streamline the end-to-end lifecycle of network-related service requests, reduce manual effort and human error, standardize approvals, and improve visibility and tracking.

2. Business Objectives

- Reduce manual effort and human error in network request handling.
- Accelerate request fulfilment times.
- Enforce standardized workflows and approval processes.
- Provide centralized visibility and tracking of requests.
- Improve the end-user experience through faster and more reliable service delivery.
- Support compliance with IT and security policies.

3. Functional Scope

- Create and manage network service requests.
- Capture requester, department, request type, priority, status, requested date, and assignment information.
- Route requests to the appropriate team or user.
- Use approval and workflow automation for controlled fulfilment.
- Track request status from creation through completion.
- Maintain audit-friendly created/updated information.

4. ServiceNow Table

A custom table named **Network request** is used for the project. The table contains fields such as Department, Assigned to, Created, Sys ID, Updated by, Updated, Created by, Number, Requested date, Request type, Requested for, Priority, and Status.

Field	Type / Purpose
Number	String – unique request number
Department	String – requester department
Assigned to	Reference – User
Requested date	Date/Time – requested fulfilment date
Request type	Choice – type of network request
Requested for	Reference – User

Priority	Choice – request priority
Status	Choice – lifecycle status

5. Project Phases

Phase 1 – Requirement Analysis & Planning

Business objectives, functional scope, stakeholder mapping, and execution roadmap.

Phase 2 – Backend Development & Configurations

Create/configure the custom table, fields, choices, references, numbering, and server-side automation.

Phase 3 – UI/UX Development & Customization

Create a user-friendly request experience, form behavior, views, lists, and client-side validations.

Phase 4 – Data Migration, Testing & Security

Validate data, perform functional testing, test workflows and approvals, and apply appropriate access controls.

Phase 5 – Deployment, Documentation & Final Presentation

Complete deployment, document the solution, demonstrate the workflow, and present project results.

6. Suggested Workflow

- User submits a network request.
- Required information is validated.
- Request is assigned/routed to the appropriate team or user.
- Approval is requested when required.
- Approved requests proceed to fulfilment.
- Request status is updated throughout the lifecycle.
- Completed requests are closed and retained for tracking/audit.

7. Testing Checklist

- Create a request with valid data.
- Verify mandatory fields and validation rules.
- Verify assignment and request routing.
- Verify approval behavior.
- Verify status transitions.
- Verify list and form display.
- Verify users can access only the records permitted by security rules.
- Verify audit information such as Created by and Updated by.

8. GitHub Repository

Recommended repository contents: this project PDF, a README.md describing the project, screenshots of the ServiceNow configuration and final workflow, and any non-sensitive configuration/documentation files. Do not upload passwords, tokens, personal data, or ServiceNow credentials.

9. Expected Outcome

The completed solution should provide a structured and automated way to manage network requests in ServiceNow, with standardized request capture, assignment, approvals, status tracking, and auditable fulfilment.

Prepared as project documentation for the ServiceNow project submission.
